Introduction The enzyme linked immunosorbent assay (ELISA) is a powerful method for detecting and quantifying a specific protein in a complex mixture. Originally described by Engvall and Perlmann (1971), the method enables analysis of protein samples immobilized in microplate wells using specific antibodies.

ELISA technical guide and protocols - Thermo Fisher Scientific

An ELISA, like other types of immunoassays, relies on antibodies to detect a target antigen using highly specific antibody-antigen interactions. In an ELISA assay, the antigen must be immobilized to a solid surface. This is done either directly or via the use of a capture antibody itself immobilized on the surface.

The basic enzyme-linked immunosorbent assay (ELISA), or enzyme immunoassay (EIA), is distinguished from other antibody-based assays because separation of specific and non-specific interactions occurs via serial binding to a solid surface, usually a polystyrene multiwell plate, and because quantitative results can be achieved.

ELISA Basics Guide - Bio-Rad

Introduction The enzyme-linked immunosorbent assay (ELISA) is one of the most commonly used labeled immunoassay techniques. It is based on an enzyme-labeled antibody capable of detecting an antigen immobilized to a solid surface, 96-well or 384-well polystyrene plates.

ELISA Guide - Creative Diagnostics

Sandwich ELISAs are the most common type of ELISA. Two specific antibodies are used to sandwich the antigen, commonly referred to as matched antibody pairs. Capture antibody is coated on a microplate, sample is added, and the protein of interest binds and is immobilized on the plate.

ELISA Development and Optimization | Thermo Fisher Scientific - US. ELISA (enzyme-linked immunosorbent assay) is a powerful method for detecting and quantifying specific proteins. ELISA typically requires that the antigen of interest be captured or immobilized on a solid surface and then be complexed with an antibody that is linked to an enzyme. Detection is accomplished by assessing the conjugated enzyme's activity via incubation with a substrate to produce a measurable product.
