4 A system delivers the maximum possible work as it undergoes a reversible process from the specified initial state to the state of its environment, that is, the dead state. This represents the useful work potential of the system at the specified state and is called exergy. Exergy represents the upper limit on the amount of work a device can deliver without

### Thermodynamics Chapter 1 (Introduction)

Energy balance when sign convention is used: (i.e., heat input and work output are positive; heat output and work input are negative). Various forms of the first-law relation for closed systems when sign convention is used. The first law cannot be proven mathematically, but no process in nature is known to have violated the first law, and this should be taken as sufficient proof.
