For long PCR and PCR with degenerate primers, start with a minimum concentration of 0.5  $\mu\text{M}$ . Other reaction components: Inappropriate DNA polymerase: Use hot-start DNA polymerases to prevent degradation of primers by the 3'→5' exonuclease activity of proofreading DNA polymerases. Hot-start DNA polymerases also increase yields of the desired PCR products by eliminating nonspecific amplification.

Frequently asked questions about PCR optimization. Three-step PCR includes denaturation, annealing, and extension steps. This type of protocol should be used when the  $T_m$  of the primers is lower than the extension temperature or is less than  $68^\circ\text{C}$ .. If the melting temperature of the primer ( $T_m$ ) is close to the extension temperature ( $72^\circ\text{C}$ ) or a few degrees lower, consider using a two-step PCR ...
