15. Early Detection In the nineteenth century, people put their ears to a railroad track to get an early warning of an approaching train. Why did this work? The velocity of sound is greater in solids than in gases. Therefore, sound travels faster in steel rails than in air, and the rails help focus the sound so it does not die out as quickly as in air. 16.

## Sound 15 Key

pressure change within a sound wave. Sound amplitude can be measured in pascals (Pa), though its more common to refer to the sound (pressure) level as Sound intensity (dB, dB SPL, dB(SPL)), and the perceived sound level as Loudness (dBA, dB(A)). Sound intensity is flow of sound energy per unit time through a fixed area.
